

INTERNSHIP REPORT

HTML & CSS RESPONSIVE LANDING PAGE

JUST INTERNSHIP

Submitted to

School of Computer Science and Engineering
IILM University, Greater Noida, U.P.

In partial fulfilment of the requirement for the degree of

B.Tech CSE

Name of Student	Nitin Kumar
Roll Number	25SCS1003003287
Batch	2035-2029
Internship Period	26 August 2026 - 10 September 2026

Academic Year 2026-27

1. CANDIDATE'S DECLARATION

I, Nitin Kumar, hereby declare that the internship report titled "HTML & CSS Responsive Landing Page Internship" has been prepared by me to fulfil the academic requirement associated with my Bachelor of Technology in Computer Science and Engineering. The work described in this report represents the practical learning and implementation carried out during my internship period from 26 August 2026 to 10 September 2026.

I further declare that the project work documented here was undertaken for educational and practical learning purposes. The report has been written to accurately describe the tasks performed, technologies used, implementation approach, testing activities, and learning outcomes. Wherever external learning resources were consulted, they have been acknowledged in the references section.

Student Declaration

I accept responsibility for the originality and accuracy of the material presented in this report.

Signature: _____

Student Name: Nitin Kumar

Roll No.: 25SCS1003003287

2. ACKNOWLEDGEMENT

I would like to express my sincere gratitude to Just Internship for providing me with the opportunity to complete a practical internship focused on HTML and CSS responsive landing page development. The internship gave me a structured environment in which I could move from basic page structure to styling, responsive layout design, navigation, JavaScript interaction, and final deployment readiness.

I am also thankful to the School of Computer Science and Engineering, IILM University, Greater Noida, for providing academic guidance and encouraging practical learning alongside classroom study. The task-oriented nature of the internship helped me connect theoretical concepts with real implementation work and understand how a small frontend project can be planned, built, tested, and prepared for publishing.

I am grateful to my faculty members, family, and everyone who supported me throughout the internship. Their encouragement helped me stay consistent, learn from implementation issues, and complete the assigned work within the internship period.

Signature: _____

Student Name: Nitin Kumar

Roll No.: 25SCS1003003287

3. INTERNSHIP COMPLETION CERTIFICATE

Certificate ID: JI-2026-000018

Figure 3.1 - Internship certificate supplied for this report

The supplied certificate records that Nitin Kumar successfully completed the HTML & CSS Responsive Landing Page internship from 26 August 2026 to 10 September 2026. It identifies the certificate as JI-2026-000018 and records the candidate's dedication, hard work, and commitment to learning.

TABLE OF CONTENTS

4. PROJECT DESCRIPTION

This report presents a detailed account of the HTML and CSS responsive landing page internship completed by Nitin Kumar. The internship followed a progressive, task-based structure in which the project evolved from semantic HTML setup to visual styling, responsive layout work, navigation behaviour, JavaScript interaction, testing, and deployment readiness.

The final project is a premium-style product landing page for a fictional workspace product named NOVA ONE. The page was intentionally implemented without a frontend framework. The final deliverable uses three primary files - index.html, styles.css, and script.js - which keeps the project easy to inspect, run locally, and understand at beginner-to-intermediate level.

Project at a glance

A responsive product landing page built with semantic HTML5, vanilla CSS, and vanilla JavaScript. The interface includes a hero section, feature cards, product design section, specifications, reviews, call-to-action area, responsive navigation, and scroll-based interaction.

4.1 Introduction

Modern landing pages are expected to communicate a product clearly while remaining fast, readable, responsive, and easy to navigate on different devices. This internship provided an opportunity to practice those requirements from the ground up using the core technologies of the web.

The project began with semantic page structure and internal anchor navigation. It was then developed through a visual system based on reusable CSS variables, typography, spacing, cards, borders, and responsive layouts. JavaScript was added only where interaction was useful, keeping presentation and behaviour separated.

4.2 ORGANIZATION / INTERNSHIP PROVIDER PROFILE

The supplied internship certificate identifies the internship provider as Just Internship and labels the activity as an HTML & CSS Responsive Landing Page internship. The certificate carries ID JI-2026-000018 and records the internship period as 26 August 2026 to 10 September 2026.

The report limits the provider profile to information supported by the supplied certificate. The internship itself was project-oriented, with emphasis on practical web development, responsive layout, and implementation using foundational frontend technologies.

4.3 PROBLEM STATEMENT

Students can understand HTML, CSS, and JavaScript as separate subjects without gaining enough experience combining them into a complete, responsive, user-facing web page. The practical problem addressed during this internship was therefore to translate a landing-page brief into a structured browser interface while maintaining good semantics, visual consistency, responsiveness, and interactive behaviour.

A second aspect of the challenge was keeping the implementation simple enough to understand and maintain. Rather than relying on a UI framework, the final project demonstrates how the same outcomes can be achieved with native HTML, CSS, and JavaScript.

4.4 PROJECT OBJECTIVES

- Create a clean project structure with separate HTML, CSS, and JavaScript files.
- Build the page using semantic HTML5 structural elements such as header, nav, main, section, article, and footer.
- Develop a consistent visual theme using CSS variables, typography, spacing, cards, borders, and reusable UI patterns.
- Use Flexbox and CSS Grid to construct responsive layouts for desktop, tablet, and mobile screens.
- Implement a responsive navigation bar with a mobile hamburger menu.
- Add lightweight JavaScript interactions including menu control, active section highlighting, scroll reveal, and dynamic year display.
- Test the landing page layout and interaction flow across different viewport sizes.

4.5 SCOPE OF THE PROJECT

The scope of the internship was limited to frontend development. The project did not require a backend, database, external API, authentication system, or advanced framework. The main scope was a polished static landing page with responsive UI and basic browser-side interaction.

- Semantic structure and internal navigation
- Custom responsive styling and CSS-based visual components
- Flexbox and Grid based layout behaviour

- Responsive mobile navigation
- JavaScript-driven interface interactions
- Basic testing, refinement, and deployment readiness

4.6 TECHNOLOGIES AND TOOLS USED

Technology / Tool	Purpose	Use in Project
HTML5	Structure and semantics	Page sections, navigation, articles, content hierarchy
CSS3	Visual design and layout	Theme, typography, cards, responsive grids, animations
Vanilla JavaScript	Interaction and DOM behaviour	Menu toggle, active nav, scroll reveal, current year
Google Fonts	Typography	Space Grotesk and DM Sans font pairing
VS Code	Development environment	Editing, organizing, and testing source files
Git / GitHub (deployment-ready workflow)	Source management	Project organization and version control readiness

4.7 SYSTEM ARCHITECTURE

The final project uses a lightweight three-layer frontend architecture. HTML provides the document structure and semantic meaning. CSS controls visual presentation and responsive layout. JavaScript adds behaviour to elements that require interaction. Because the project is static, the browser loads these files directly and renders the complete experience on the client side.

Layer	Component	Responsibility
Presentation	index.html	Semantic structure, content hierarchy and internal links
Styling	styles.css	Theme, layout, responsive breakpoints, animation
Interaction	script.js	Navigation, observer logic, active links, utility behaviour
Runtime	Web browser	Loads and renders the static application

4.8 METHODOLOGY

The internship followed a practical project-based methodology. Each stage built on the previous one so that the final page remained structured and testable throughout development.

Phase	Activity	Output
1	Understand requirements	Identified structural, styling, responsiveness, navigation and deployment requirements
2	Semantic HTML setup	Page skeleton and anchor-linked sections
3	CSS theme and styling	Typography, variables, spacing, cards and visual hierarchy
4	Responsive layout	Flexbox/Grid based desktop, tablet and mobile behaviour
5	JavaScript interaction	Hamburger menu, active navigation, scroll reveal, dynamic year
6	Testing and refinement	Interaction checks and viewport-based layout adjustments
7	Final documentation	README, submission note, and internship report

Development Approach

1. Start with content and structural hierarchy before visual styling.
2. Create reusable design tokens using CSS variables so spacing, colors, borders, and typography remain consistent.
3. Use CSS Grid for large responsive compositions and Flexbox for alignment and compact groups.
4. Keep JavaScript focused on behaviour rather than visual styling.
5. Use IntersectionObserver for efficient scroll-based reveal behaviour.
6. Check the layout at common mobile, tablet, and desktop widths and refine breakpoints where text or components become constrained.
7. Keep the project framework-free so every major frontend decision remains visible in the source code.

4.9 TASK-WISE IMPLEMENTATION

Task 1 - Project Setup & Semantic HTML

Objective: initialize a clean directory structure and build the page skeleton using semantic HTML5.

The page structure was organized around a header/navigation area followed by a main content region and multiple semantic sections. The navigation uses internal anchor links so users can jump directly to Features, Design, Specs, Reviews, and the purchase section. Articles were used for repeated feature and review content, while the footer contains the closing site information.

- Used semantic header, nav, main, section, article, and footer elements.
- Added meaningful IDs to major sections for internal navigation.
- Kept the document hierarchy readable and easy to inspect.
- Separated structure from styling and behaviour into three files.

Task 2 - CSS Theme & Styling

Objective: create a consistent visual system for typography, colors, spacing, and page blocks.

The stylesheet uses CSS custom properties to centralize the theme. A dark navy background, muted text, cool accent blue, and small mint highlights create a modern product-technology visual language. Reusable card styling, border treatments, shadows, and spacing rules help the page feel like one coherent interface rather than a collection of unrelated sections.

- Defined reusable variables for colors, radii, shadows, and layout width.
- Integrated a display font and body font using Google Fonts.
- Created responsive buttons, feature cards, tables, review cards, and call-to-action components.
- Used CSS-only decorative product illustrations to avoid unnecessary image dependencies.

Task 3 - Flexbox / Grid Responsiveness

Objective: adapt the landing page across device widths using responsive layout techniques.

Responsive behaviour was treated as part of the design rather than an afterthought. Grid layouts change their column structure at tablet and mobile widths, while Flexbox is used for navigation groups, buttons, review metadata, and other one-dimensional alignment problems.

- Desktop feature sections use multi-column Grid arrangements.
- Tablet layouts collapse large compositions to fewer columns.
- Mobile layouts switch to a single-column reading flow where necessary.
- Typography uses clamp() for controlled scaling.
- Mobile navigation changes from a horizontal menu into a hamburger-triggered panel.
- Spacing and visual scale are reduced at smaller widths to prevent overflow.

Task 4 - Navigation & Deployment Readiness

Objective: add responsive menu behaviour, perform a final layout audit, and prepare the static page for hosting.

The navigation includes a mobile toggle controlled through JavaScript. The menu closes after a selection, on Escape, when clicking outside the menu, and when the viewport returns to desktop size. Active section highlighting is handled with IntersectionObserver so the navigation can reflect the section currently in view.

The final project was kept deployment-ready as a static website. Because there is no build step, the three project files can be hosted by any static site platform that serves HTML, CSS, and JavaScript files. The report documents deployment readiness rather than claiming a live public URL where none was supplied.

4.10 RESPONSIVE DESIGN AND UI DECISIONS

The landing page was designed around a clear visual hierarchy. The hero section introduces the product and provides two primary actions. Supporting metrics create credibility without overwhelming the user. Feature cards then explain the product, while the design and specification sections provide deeper information. Reviews add social proof and the final call-to-action gives the page a clear conversion point.

Area	Design Decision	Reason
Hero	Large headline + product visual + two CTAs	Immediate product understanding and clear next steps
Features	Card-based modular layout	Easy scanning and flexible responsive stacking
Design	Split layout with focused copy	Balances visual storytelling and supporting details
Specifications	Simple two-column rows	Makes technical information easy to compare
Reviews	Three independent cards	Provides social proof without a long text block
CTA	High-contrast purchase block	Creates a strong closing action

4.11 TESTING AND VALIDATION

Testing focused on the areas most important to a static responsive landing page: visual layout, navigation, responsive behaviour, and JavaScript interactions. The page was designed so that core content remains usable even when motion is reduced or unsupported.

Test Area	Check	Expected Result	Status
Desktop layout	Wide viewport rendering	Balanced two-column hero and multi-column sections	Passed
Tablet layout	Medium viewport rendering	Reduced columns and stable spacing	Passed
Mobile layout	Narrow viewport rendering	Single-column content and no horizontal overflow	Passed
Navigation	Open/close mobile menu	Menu toggles and closes correctly	Passed
Anchor links	Section navigation	Correct section opens	Passed
Active nav	Scroll through sections	Current section is highlighted	Passed
Scroll reveal	Enter sections while scrolling	Reveal class is applied when visible	Passed
Reduced motion	User preference enabled	Content remains immediately visible	Supported

4.12 CHALLENGES AND SOLUTIONS

Challenge	Solution Applied	Learning
Keeping the interface modern without a framework	Built reusable CSS patterns, variables, gradients and custom visual elements	Strong CSS can create sophisticated UI without depending on component libraries
Preventing overflow on small screens	Introduced responsive breakpoints, fluid typography, and layout collapse rules	Responsive design must be considered at component level
Making mobile navigation reliable	Used a dedicated toggle state with outside-click and Escape handling	Small interaction details improve usability
Adding animation without hurting usability	Used IntersectionObserver and respected prefers-reduced-motion	Motion should support the interface rather than distract from it
Keeping the project easy to understand	Maintained only index.html, styles.css, and script.js	Simple project architecture is useful for learning and handoff

4.13 LEARNING OUTCOMES

- Improved understanding of semantic HTML and accessible document structure.
- Practical experience with CSS variables, typography, spacing, borders, gradients, and reusable visual patterns.
- Better understanding of Flexbox and CSS Grid for real responsive layouts.
- Hands-on practice with media queries and mobile-first thinking.
- Experience using JavaScript events and DOM APIs for interface interaction.
- Understanding of IntersectionObserver for viewport-based UI behaviour.
- Improved ability to organize a complete static project into clean, separated files.
- Greater confidence in testing and refining a webpage across device sizes.
- Better understanding of the workflow from task brief to final deliverable and documentation.

4.14 CONCLUSION AND FUTURE SCOPE

The internship provided practical exposure to the complete lifecycle of a small frontend project. Starting from semantic HTML, the work progressed through visual styling, responsive layout, navigation, JavaScript interaction, testing, and deployment readiness. The final NOVA ONE landing page demonstrates that a professional-looking user interface can be created with a small and transparent technology stack.

The experience also helped strengthen problem-solving skills. Instead of relying on a framework to solve layout and interaction challenges, the implementation required direct use of browser fundamentals. This made the relationship between HTML structure, CSS presentation, and JavaScript behaviour clearer.

- Replace CSS-only product artwork with optimized real product imagery where available.
- Connect the CTA to a real backend, commerce system, or lead form.
- Add accessibility audits and keyboard interaction testing for production release.
- Add automated visual or end-to-end testing for regression checks.
- Deploy the static site to a production host and connect a custom domain.
